

## How to Fix Missing Visuals (Install Tailwind CSS)

If you see only text and no colors/layout, follow these exact steps to install the styling engine.

### Step 1: Install the Styling Tools

1. Go to your terminal (inside the `aqua-track` folder).
2. If the server is running, stop it by pressing **Ctrl + C**.
3. Run this command:

```
npm install -D tailwindcss postcss autoprefixer  
npx tailwindcss init -p
```

(This creates a `tailwind.config.js` file in your folder).

**Troubleshooting (Windows):** If you see an error saying `could not determine executable to run`, run this specific command instead:

```
.\node_modules\.bin\tailwindcss.cmd init -p
```

### Step 2: Configure the Settings

1. Open the file `tailwind.config.js` in VS Code.
2. Delete everything inside it and paste this:

```
/** @type {import('tailwindcss').Config} */  
export default {  
  content: [  
    "./index.html",  
    "./src/**/*.{js,ts,jsx,tsx}",  
  ],  
  theme: {  
    extend: {},  
  },  
  plugins: [],  
}
```

### Step 3: Add the Styles

1. Go to the folder `src` and open `index.css`.
2. **Delete everything** in that file.

3. Paste these three lines at the very top:

```
@tailwind base;  
@tailwind components;  
@tailwind utilities;
```

#### Step 4: Restart

1. Run `npm run dev` again.
2. Check your browser. You should now see the full graphical interface!
